No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 179,

and the vestibule.

-!- PTM: N-glycosylated.
-!- PTM: A 50 kDa form is created by proteolytic cleavage.
-!- PTM: A 50 kDa form is created by proteolytic cleavage.
-!- PTM: A 50 kDa form is created by proteolytic cleavage.
-!- PTM: A 50 kDa form is created by proteolytic cleavage.
-!- DISEASE: Defects in COCH are the cause of autosomal dominant nonsyndromic sensorineural deafness type 9 (DFNA9) [MIN:601369].
-!- Hearing loss begins in the fourth or fifth decade of life and initially involves the high frequencies. Deafness is progressive and usually complete by the sixth decade. In addition to cochlear involvement, DFNA9 patients also exhibit a spectrum of vestibular dysfunctions. Penetrance of the vestibular symptom is often incomplete, and some patients are minimally affected, whereas others suffer from severe balance disturbances and episodes of vertigo. Affected individuals have mucopolysaccharide depositions in the channels of the cochlear and vestibular nerves. These depositions apparently cause strangulation and degeneration of dendritic fibers. Usami S., Takahashi K., Yuge I., Ohtsuka A., Namba A., Abe S., Fransen E., Patthy L., Ottling G., Van Camp G.; Partiations in the COCH gene are a frequent cause of autosomal dominant progressive cochleo-vestibular dysfunction, but not of Meniere's extracellular matrix. -!- TISSUB SPECIFICITY: Expressed in inner ear structures; the cochlea HARACTERIZATION OF VARIANTS DFNA9 SER-51; GLY-66; GLU-88; ASN-109 AND "Mucations in COCH that result in non-syndromic autosomal dominant deafness (DFNA9) affect matrix deposition of cochlin.";

Hum. Genet. 113:406-416(2003).

"Large and small splice variants of collagen XII: differential
expression and ligand binding.";
J. Cell Biol. 130:1005-1014(1995).
-!- FUNCTION: Type XII collagen interacts with type I collagen-
containing fibrils, the COLI domain could be associated with the
surface of the fibrils, and the COLI and NC3 domains may be
localized in the perifibrillar matrix.
-!- SUBUNIT: Trimer of identical chains each containing 190 kba of
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Gordon M.K., Gerecke D.R., Dublet B., van der Rest M., Olsen B.R., Type XII collagen. A large multidomain molecule with partial homology to type IX collagen. †
J. Biol. Chem. 264:19772-19778(1989).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 TISSUB=Embryo;

Comment=The final tissue form of collagen XII may contain
homotrimers of either isoform Long or isoform Short or any
combination of isoform Long and isoform Short. Only isoform
is a proteoglycan. Isoform Long has more restricted expression
in embryonic tissue than isoform Short;
                                                                                                                                                                                                                                                                                                                                                                                        -I- PTM: Prolines at the third position of the tripeptide repeating unit (G-X-Y) are hydroxylated in some or all of the chains.
                                                                                                                                                                                      ISOIGEP13944-2; Sequence=VSP 001148;
ISOIGEP13944-2; Sequence=VSP 001148;
IISOIGE SPECIFICITY: Type XII collagen is present in tendons,
ligaments, perichondrium, and periosteum, all dense connective
tissues containing type I collagen.
DOWAIN: This sequence defines five distinct domains, two triple-
helical domains (COL1 and COL2) and three nontriple-helical
domains (NCI, NCZ, and NC3).
PTM: The triple-helical tail is stabilized by disulfide bonds at
                                                                                                                                                                                                                                                                                                                                                                                                                                                                              -|- SIMILARITY: BELONGS TO THE FIBRIL-ASSOCIATED COLLAGENS WITH INTERRUPTED HELLCES (FACIT) FAMILY.
-|- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
-|- SIMILARITY: Contains 4 VWFA domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   -!- SIMILARITY: Contains 18 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        POTENTÍAL.

Structural variation of type XII collagen at its carboxyl-terminal

To Structural variation of type XII collagen at its carboxyl-terminal

WC1 domain generated by tissue-specific alternative splicing.*;

J. Biol. Chem. 274:22053-22059(1999).

J. Biol. Chem. 274:22053-22059(1999).

Containing fibrils, the CC01 domain could be associated with the surface of the fibrils, and the CC02 and NC3 domains may be localized in the perfifbrillar matrix (By similarity).

Containing spoucras sequences (By similarity).

C.I. ALTERNATIVE PRODUCTS:

Comment-Alternative Splicing; Named isoforms=4;

Comment-The final tissue form of collagen XII may contain homotrimers or any combination of the various isoforms;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               ISOId-60047-4; Sequence=VSP 001150, VSP 001151, VSP 001152; ISOId-60047-4; Sequence=VSP 001150, VSP 001151, VSP 001152; TISSUB SPRCIPICITY: Highest expression in tendons, perichondrium, skin, cornea, sclera, blood vessels, and periosteum. DEVELOPMENTAL STAGE: The long NC3 XIIA isoforms are predominant at early stages (ED7 and 11); at later stages of development (BD15 and 17) the short NC3 XIIB forms become the major forms. As the short NC3 forms become the major forms are the short NC3 forms become the wajor product, the long splice variant

T SIGNAL
-!- FTM: O-glycosylation of isoform XIIA-2; glycosaminoglycan of chondroitin-sulfate type (By similarity)
-!- SIMILARITY: BELONGS TO THE FIBRIL-ASSOCIATED COLLAGENS WITH INTERRUPTED HELICES (FAMILY.
-!- SIMILARITY: Contains 1 TSP N-terminal (TSPN) domain.
-!- SIMILARITY: Contains 4 WWPA domains.
-!- SIMILARITY: Contains 18 fibronectin type III domains.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    COLLAGEN ALPHA 1(XII) CHAIN FIBRONECTIN TYPE-III 1.

Gerecke D.R., Olson P.F., Koch M., Knoll J.H.M., Taylor R.,
Hudson D.L., Champliaud M.-F., Olsen B.R., Burgeson R.E.;
T. Complete primary structure of two splice variants of collagen XII,
and assignment of alpha 1(XII) collagen (COL12A1), alpha 1(IX)
collagen (COL9A1), and alpha 1(XIX) collagen (COL12A1), alpha 1(IX)
collagen (COL9A1), and alpha 1(XIX) collagen (COL19A1) to human
chromosome 6q12-q13."

Genomics 41:236-242(1997).

Celecke A1:236-242(1997).

Containing fibrils, the COL1 domain could be associated with the surface of the fibrils, and the COL2 and NC3 domains may be localized in the perifibrillar matrix (By similarity).

Celecke Demonstration of alpha 1(XIX) collagen containing 190 kDa of incertiple-relacal chains each containing 190 kDa of containing 19

of cartilage matrix protein within the von Willebrand factor type A-
Iike module superfamily.

I ike module superfamily.

i J. Biol. Chem. 272:9268-9274(1997).

c. I FUNCTION: Involved in matrix assembly (By similarity).

c. I FUNCTION: Detected in a variety of organs, including calvaria, uterus, heart and brain, as well as fibroblast and calvaria. terus.

c. I TISSUB SPECIFICITY: Detected in a variety of organs, including calvaria uterus, heart and brain, as well as fibroblast and conteoblast cell lines.

c. I SIMILARITY: Contains 10 EGP-like domains.
